## SITE OF THE RADIO WAVE OBSERVATORIES

Ionospheric observation is carried out at the following four observatories in Japan.

|           | Latitude   | Longitude   | Site   |
|-----------|------------|-------------|--|
| Wakkanai  | 45°23.6'N. | 141°41.1'E. | Wakkanai-shi, Hokkaido                       |
| Akita     | 39°43.5'N. | 140°08.2'E. | Tegata Nishishin-machi, Akita-shi, Akita-ken |
| Kokubunji | 35°42.4'N. | 139°29.3'E. | Koganei-shi, Tokyo-to                        |
| Yamagawa  | 31°12.1'N. | 130°37.1'E. | Yamagawa-machi, Ibusuki-gun, Kagoshima-ken   |

Solar radio emission and radio propagation conditions are observed at Hiraiso Radio Wave Observatory.

|         | Latitude   | Longitude   | Site                                       |

## SYMBOLS AND TERMINOLOGY

### A. IONOSPHERE

All symbols and terminology in the table of ionospheric data are used in accordance with the "URSI Handbook of Ionogram Interpretation and Reduction," 1961.

#### Terminology

|                  |   |
|------------------|---|
| $f_0F2$          | The ordinary wave critical frequency for the $F2$ , $F1$ and $E$ layers, respectively.  |
| $f_0F1$          |   |
| $f_0E$           |   |
| $f_0E_s$         | The ordinary wave top frequency corresponding to highest frequency at which a mainly continuous trace is observed.  |
| $f_bE_s$         | The lowest ordinary wave frequency at which the $E_s$ layer begins to become transparent. This is usually determined from the minimum frequency at which reflections from layers at greater heights are observed.   |
| $f_{\text{min}}$ | The frequency below which no echoes are observed.   |
| $M(3000)F2$      | The maximum usable frequency factor for a path of 3000 km for transmission by $F2$ layer.   |
| $M(3000)F1$      | The maximum usable frequency factor for a path of 3000 km for transmission by $F1$ layer.   |
| $h'F2$           | The minimum virtual height, $h'F2$ , refers to the highest, most stable stratification observed in the $F$ region and can only be scaled when such stratification is present.   |
| $h'F$            | The natural and most significant $F$ region virtual height parameter is that for lowest $F$ region stratification. This will be denoted by $h'F$ . Thus $h'F$ is identical with the current $h'F2$ when $F$ region stratification is absent, e.g., at night, and with the current $h'F1$ when $F1$ stratification is present. |
| $h'E_s$          | The lowest virtual height of the trace used to give the $f_0E_s$ .  |
| $h'F2$           | The virtual height of the $F2$ layer measured on the ordinary   |

*ypF2*

wave branch at a frequency equal to  $0.834f_0F2$ .

The semi-thickness of the *F2* layer deduced from a parabolic fit to the "nose" of the electron density distribution with height and based on the observed *hf* trace. (The difference between *hpF2* and the virtual height at  $0.969f_0F2$ ).

**a. Descriptive Letters**

The following letters are entered after or used to replace a numerical value on the monthly tabulation sheets.

- A Measurement influenced by, or impossible because of, the presence of a lower thin layer, for example *E<sub>s</sub>*.
- B Measurement influenced by, or impossible because of, absorption in the vicinity of *f-min*.
- C Measurement influenced by, or impossible because of, any non-ionospheric reason.
- D Measurement influenced by, or impossible because of, the upper limit of the normal frequency range. Used in a qualifying sense, see below.
- E Measurement influenced by, or impossible because of, the lower limit of the normal frequency range. Used in a qualifying sense, see below.
- F Measurement influenced by, or impossible because of, the presence of spread echoes.
- G Measurement influenced or impossible because the ionization density of the layer is too small to enable it to be made accurately.
- H Measurement influenced by, or impossible because of, the presence of a stratification.
- L Measurement influenced or impossible because the trace has no sufficiently definite cusp between layers.
- M Interpretation of measurement questionable because the ordinary and extraordinary components are not distinguishable.
- N Conditions are such that the measurement cannot be interpreted.
- O Measurement refers to the ordinary component.
- R Measurement influenced by, or impossible because of, attenuation in the vicinity of a critical frequency.
- S Measurement influenced by, or impossible because of, interference or atmospherics.
- T Value determined by a sequence of observations, the actual observation being inconsistent or doubtful.
- V Forked trace which may influence the measurement.
- W Measurement influenced or impossible because the echo lies outside the height range recorded.
- X Measurement refers to the extraordinary component.
- Y Intermittent trace.
- Z Third magneto-ionic component present.

**b. Qualifying Letters**

The following letters are entered in the first column before a numerical

value on the monthly tabulation sheets.

- D greater than.
- E less than.
- I Missing value has been replaced by an interpolated value.
- J Ordinary component characteristic deduced from the extraordinary component.
- O Extraordinary component characteristic deduced from the ordinary component. (Used for x- characteristics only.)
- T Value determined by a sequence of observations, the actual observation being inconsistent or doubtful.
- U Uncertain or doubtful numerical value.
- Z Measurement deduced from the third magneto-ionic component.

**c. Description of Standard Types of  $E_s$**

The eight standard types of  $E_s$  are identified by corresponding lower case letters:  $f, l, c, h, q, r, a, s$ . These letters suggest the names flat, low, cusp, high, equatorial, retardation, auroral and slant, respectively. It is strongly emphasized that these names are not restrictive. The letter 'n' is used to designate any  $E_s$  trace that does not correspond to any of the eight types.

- $f$  An  $E_s$  trace which shows no appreciable increase of height with frequency. The trace is usually relatively solid at most latitudes. This classification may only be used at night; apparently flat  $E_s$  traces observed in the daytime are classified according to their virtual height:  $h$  or  $l$ .
- $l$  A flat  $E_s$  trace at or below the normal  $E$  layer minimum virtual height in the day or below the night  $E$  layer minimum virtual height at night.
- $c$  An  $E_s$  trace showing a relatively symmetrical cusp at or below  $f_0E$ . This is usually continuous with the normal  $E$  trace, although when the deviative absorption is large, part or all of the cusp may be missing. (Usually a daytime type.)
- $h$  An  $E_s$  trace showing a discontinuity in height with the normal  $E$  layer trace at or above  $f_0E$ . The cusp is not symmetrical, the low frequency end of the  $E_s$  trace lying clearly above the high frequency end of the normal  $E$  trace. (Usually a daytime type.)
- $q$  An  $E_s$  trace which is diffuse and non-blanketing over a wide frequency range. The spread is most pronounced at the upper edge of the trace. (This type is common in daytime in the vicinity of the magnetic equator.)
- $r$  An  $E_s$  trace showing an increase in virtual height at the high frequency end similar to group retardation but which is non-blanketing over part or all of its frequency range. This is distinguished from the usual group retardation (as in the case of an occulting thick  $E$  layer) by the lack of group retardation in the  $F$  layer traces at corresponding frequencies and the lack of complete blanketing.
- $a$  An  $E_s$  having a well defined flat or gradually rising lower edge with stratified and diffuse (spread) traces present above it. These

sometimes extend over several hundred kilometers of virtual height.

*s* A diffuse  $E_s$  trace which rises steadily with frequency and usually emerges from another type  $E_s$  trace. The rising trace alone is classified as 's'; the horizontal trace is classified separately. At high latitudes the slant trace usually starts to rise from a horizontal  $E_s$  trace such as  $E_{s-l}$  or  $E_{s-f}$ , at frequencies which greatly exceed the  $E$  layer critical frequency, whereas at low latitudes it usually rises from  $E_{s-q}$ ,  $E_{s-c}$ , or  $E_{s-h}$  at frequencies near the regular  $E$  critical frequency. Type *s* is never used to determine  $f_0E_s$  and  $h'E_s$ . The slant trace is sometimes observed to start at  $f_0E$  without echoes clearly identifiable as  $E_s$  echoes being seen.

*n* The designation 'n' is used to denote an  $E_s$  trace which cannot be classified into one of the standard types. When a trace appears to be intermediate between any two classes a choice should be made whenever possible even if it is uncertain. 'n' should be used sparingly.

#### d. Multiple Reflections from $E_s$

When the ionogram shows the presence of multiple reflections from  $E_s$  the number of traces seen should be recorded after the letter indicating the type.

## B. SOLAR RADIO EMISSION

Solar radio observations are carried out on 200 and 500 Mc/s at Hiraiso Radio Wave Observatory.

Antennas are a broadside array of  $6 \times 4$  doublets for 200 Mc/s and a parabolic reflector of 5 meter for 500 Mc/s, each having the total power receiver.

Observations are feasible almost from sunrise to sunset.

#### a. Time and Unit

The time is expressed as U.T.

The unit is  $10^{-22} \text{ W} \cdot \text{m}^{-2} \cdot (\text{c/s})^{-1}$  for both components of polarization.

#### b. Daily Data

##### *Flux density*

The three-hourly and daily mean values are given.

##### *Variability*

The three-hourly and daily mean values are given at 200 Mc/s only.

Variability is expressed in the following four grades:

0=Quiet or no burst,

1=A few bursts,

2=Many bursts,

3=Very many bursts.

The number of bursts exceeding the flux level is counted.

### c. Distinctive Events

The phenomena are picked up on the following criteria:

1. Distinct from the prevailing kind of activity,
2. Correlated with other known solar phenomena,
3. Remarkable change-over from one situation to another.

*Starting time* and *Time of maximum* are given to nearest minute in general, but to nearest a tenth minute for short intense occurrences or clear commencements.

*Duration* is given in minutes and to nearest a tenth minute, if short or clear.

*Descriptive type* is denoted by the following symbols:

- S =Simple rise and fall of intensity;
- C =Complex variation of intensity,
- C + =Prolonged broad-band enhancement of radiation,  
generally of spectral type IV ;
- F =Group of bursts: multiple peaks probably belonging  
to the same event, but separated by relatively short  
period of quietness ;
- RF =More or less irregular rise and fall of intensity, at  
metric or decimetric wavelengths ;
- e =Sudden beginning of burst with steep rise of inten-  
sity ;
- E =Steep rise of intensity of continuum background ;
- p.i.=post-burst increase ;
- onset storm=clear-cut beginning of a noise storm.

*Peak intensity* is the flux density of the highest peak reached during the occurrence, measured above the pre-burst level.

*Mean intensity* is the flux density averaged over the burst's duration, measured above the pre-burst level; therefore, multiplying the duration, the total energy of the occurrence can be estimated.

## C. RADIO PROPAGATION CONDITIONS

### a. Field Intensities of WWV and WWVH

Field intensity observations of WWV and WWVH transmitted from Washington D.C. and Hawaii, respectively, are carried out at Hiraiso Radio Wave Observatory. In order to avoid interferences with several standard frequency waves on the same frequency, the upper side-band of 440 c/s is picked up by the use of a narrow band pass filter of  $\pm 40$  c/s bandwidth.

Tabulated *field intensity* is the average of peak value of the incident upper side-band field intensity in dB above one microvolt per meter. The *duration* of observation is two minutes for WWV and three minutes for WWVH following the time indicated in universal time on the table.

Particulars of the transmitter and receiver are summarized in the following tables:

**Transmitter**

|          | WWV  | WWVH  |
|----------|--|---|
| Location | Washington, D.C. Long. 76°51' W<br>Lat. 39°00' N | Maui, Hawaii Long. 156°28' W<br>Lat. 20°46' N |
| Power    | 3 kW for the upper side-band                     | 0.5 kW* for the upper side-band               |
| Antenna  | $\lambda/2$ vertical                             | $\lambda/2$ vertical                          |
| Distance | 10050 km   | 6270 km                                       |

\* Reduced from the carrier power of 2 kW with amplitude modulation of 100%.

**Receiver**

|             |                                      |
|-------------|--------------------------------------|
| Antenna     | 4.5 m vertical rod                   |
| Bandwidth   | $\pm 40$ c/s for the upper side-band |
| Calibration | each half hour                       |

*Descriptive symbols* are as follows:

- C: Measurement influenced by, or impossible because of, any non-propagational reasons.
- S: Measurement influenced by, or impossible because of, interferences or atmospherics.
- ( ): Unaccurate measurement influenced by interferences, atmospherics, or non-propagational reasons.
- <: Less than the following figure.

**b. Radio Propagation Quality Figures**

Radio propagation quality figures are usually expressed on the scale that ranges from one to five as follows:

- |                              |          |
|------------------------------|----------|
| 1=very poor (very disturbed) | 4=normal |
| 2=poor (disturbed)           | 5=good   |
| 3=rather poor (unstable)     |          |

The tabulated circuits contain London (commercial circuit), WWV (frequencies 10, 15, 20 Mc broadcast from Washington, D.C.), San Francisco (commercial circuit) and WWVH (frequencies 10, 15 Mc broadcast from Hawaii), which are received at Hiraiso Radio Wave Observatory near Tokyo.

Warnings of radio propagation broadcast from JJY station are expressed in three grades:

- |             |  |
|-------------|--|
| N=normal    |  |
| U=unstable  |  |
| W=disturbed |  |

The letter W expresses disturbed condition expected to be during the following 12 hours after issue. The letter U and N means also unstable or normal conditions, respectively.

Whole day radio quality indices are the averages of the 6-hourly indices of London, WWV and S. F.

Start- and end-time of principal geomagnetic storms closely correlated to radio propagation conditions are tabulated from observations at Kakioka.

**c. Sudden Ionospheric Disturbance (S. I. D.)**

The data of short wave fade-out (SWF) are prepared from the field intensity records on following circuits received at Hiraiso. Characteristics of the phenomenon are classified as follows.

*Circuits and Drop-out intensity*

WS .....WWV 20Mc, 15Mc and 10Mc (Washington)

S F .....Various commercial circuits (San Francisco)

H A .....WWVH 15 Mc and 10 Mc (Hawaii)

T O .....JJY 15 Mc and 10 Mc (Tokyo)

S H .....BPV 15 Mc and 10 Mc (Shanghai)

L N .....Various commercial circuits (London)

Start-time and Duration, Types and Importances are described from the data of a circuit whose Drop-out Intensity is underlined. Drop-out Intensities of 10 Mc ('), 15 Mc (none) and 20 Mc (").

*Start-times and Durations*

*Types*

S : sudden drop-out and gradual recoverly

Slow: slow drop-out taking 5 to 15 minutes and gradual recoverly

G : gradual disturbances; fade irregular in both drop-out and recoverly

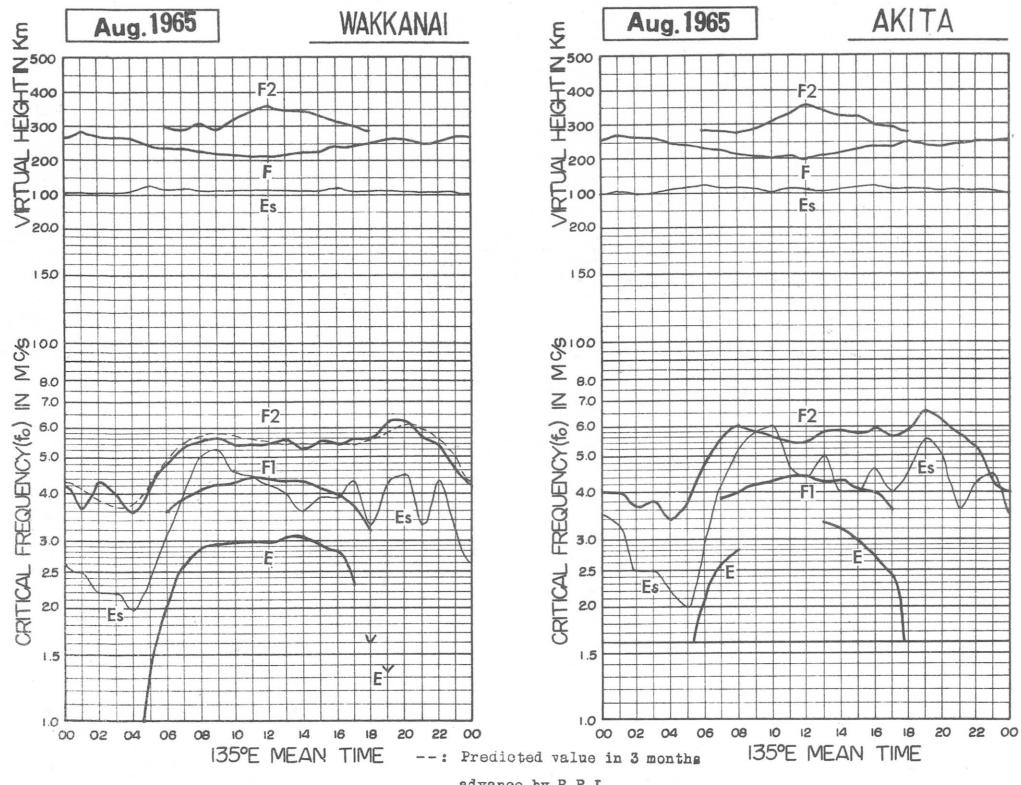

*Importances*

Degrees of SWF are classified into 9 grades according to the amplitude of fade-out;

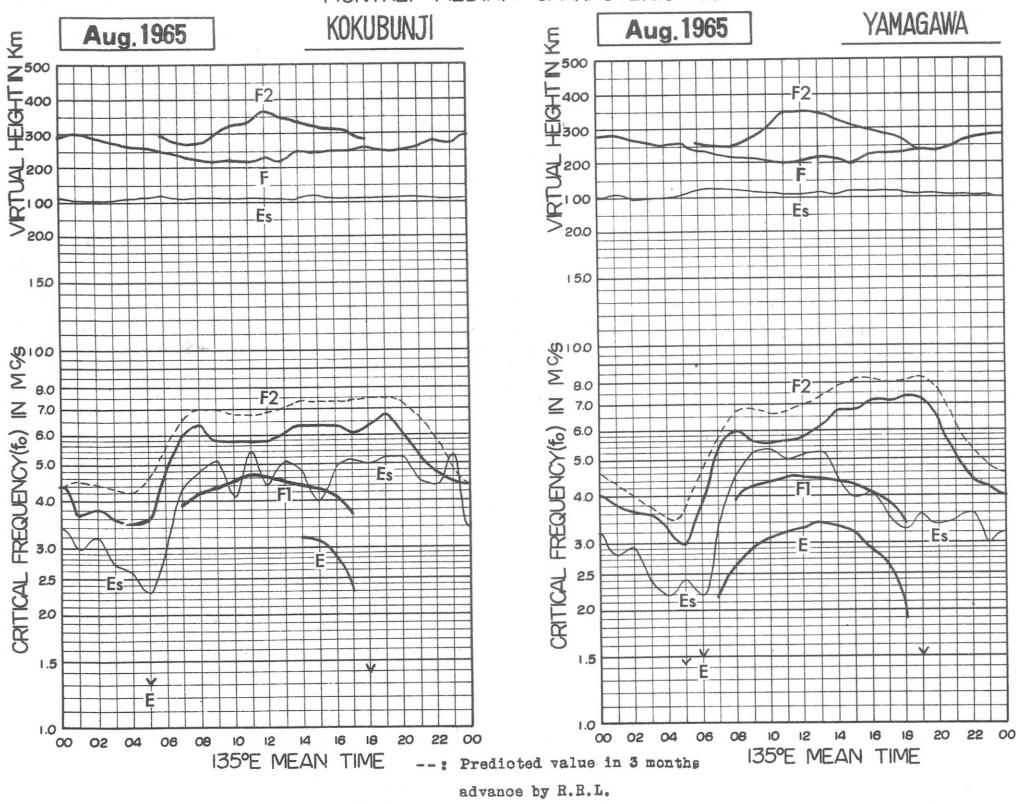

|    |   |    |
|----|---|----|
| 1- | 1 | 1+ |
| 2- | 2 | 2+ |
| 3- | 3 | 3+ |

Besides, the time associated phenomena of SID's, that is, solar flare, solar radio noise outburst and crochet (solar flare effect in magnetic record) are given in this table from interchange messages or measurements at Hiraiso.

Distinctive Event

No Distinctive Event was observed during August, 1965.

July 1965      Frequency: 15 Mc/s, Bandwidth:  $\pm 40$  c/s, Receiving Antenna: Rod (4.5 m)      Measurement of H.F. Field Strength (Upper Side-band of WWW)      Measured at Hiraiso

Measurement of H.F. Field Strength (Upper Side-band of WWWH)  
Frequency: 15 Mc/s, Bandwidth:  $\pm 40$  c/s, Receiving Antenna: Rod (4.5 m)
