SITE OF THE RADIO WAVE OBSERVATORIES AND HIRAIKO BRANCH

Ionospheric observation is carried out at the following four observatories in Japan.

| | Latitude | Longitude | Site |
|-----------|------------|-------------|--|
| Wakkai | 45°23.6'N. | 141°41.1'E. | Midori-cho, Wakkai-shi, Hokkaido |
| Akita | 39°43.5'N. | 140°08.2'E. | Tegata Sumiyoshi-cho, Akita-shi, Akita-ken |
| Kokubunji | 35°42.4'N. | 139°29.3'E. | Nukui-Kitamachi, Koganei-shi, Tokyo-to |
| Yamagawa | 31°12.1'N. | 130°37.1'E. | Yamagawa-machi, Ibusuki-gun, Kagoshima-ken |

Solar radio emission and radio propagation conditions are observed at Hiraiso Branch and Inubo Radio Wave Observatory.

| | Latitude | Longitude | Site |
|---------|------------|-------------|--|
| Hiraiso | 36°22.0'N. | 140°37.5'E. | Isozaki-machi, Nakaminato-shi, Ibaraki-ken |
| Inubo | 35°42.2'N. | 140°51.5'E. | 9912 Tennodai, Choshi-shi, Chiba-ken |

SYMBOLS AND TERMINOLOGY

A. IONOSPHERE

All symbols and terminology in the table of ionospheric data are used in accordance with the "URSI Handbook of Ionogram Interpretation and Reduction," 1961.

Terminology

| | |
|------------------|---|
| f_0F2 | The ordinary wave critical frequency for the $F2$, $F1$ and E layers, respectively. |
| f_0F1 | |
| f_0E | |
| f_0Es | The ordinary wave top frequency corresponding to highest frequency at which a mainly continuous trace is observed. |
| f_{bEs} | The lowest ordinary wave frequency at which the E layer begins to become transparent. This is usually determined from the minimum frequency at which reflections from layers at greater heights are observed. |
| f_{min} | The frequency below which no echoes are observed. |
| $M(3000) F2$ | The maximum usable frequency factor for a path of 3000 km for transmission by $F2$ layer. |
| $M(3000) F1$ | The maximum usable frequency factor for a path of 3000 km for transmission by $F1$ layer. |
| $h'F2$ | The minimum virtual height, $h'F2$, refers to the highest, most stable stratification observed in the F region and can only be scaled when such stratification is present. |
| $h'F$ | The natural and most significant F region virtual height parameter is that for lowest F region stratification. This will be denoted by $h'F$. Thus $h'F$ is identical with the current $h'F2$ when F region stratification is absent, e.g., at night, and with the current $h'F1$ when $F1$ stratification is present. |
| $h'Es$ | The lowest virtual height of the trace used to give the f_0Es . |
| h_pF2 | The virtual height of the $F2$ layer measured on the ordinary |

ypF2

wave component at a frequency equal to $0.834f_0F2$.

The semi-thickness of the $F2$ layer deduced from a parabolic fit to the "nose" of the electron density distribution with height and based on the observed $h'f$ trace. (The difference between $hpF2$ and the virtual height at $0.969f_0F2$).

a. Descriptive Letters

The following letters are entered after or used to replace a numerical value on the monthly tabulation sheets.

- A Measurement influenced by, or impossible because of, the presence of a lower thin layer, for example E_s .
- B Measurement influenced by, or impossible because of, absorption in the vicinity of f_{-min} .
- C Measurement influenced by, or impossible because of, any non-ionospheric reason.
- D Measurement influenced by, or impossible because of, the upper limit of the normal frequency range. Used in a qualifying sense, see below.
- E Measurement influenced by, or impossible because of, the lower limit of the normal frequency range. Used in a qualifying sense, see below.
- F Measurement influenced by, or impossible because of, the presence of spread echoes.
- G Measurement influenced or impossible because the ionization density of the layer is too small to enable it to be made accurately.
- H Measurement influenced by, or impossible because of, the presence of a stratification.
- L Measurement influenced or impossible because the trace has no sufficiently definite cusp between layers.
- M Interpretation of measurement questionable because the ordinary and extraordinary components are not distinguishable.
- N Conditions are such that the measurement cannot be interpreted.
- O Measurement refers to the ordinary component.
- R Measurement influenced by, or impossible because of, attenuation in the vicinity of a critical frequency.
- S Measurement influenced by, or impossible because of, interference or atmospherics.
- T Value determined by a sequence of observations, the actual observation being inconsistent or doubtful.
- V Forked trace which may influence the measurement.
- W Measurement influenced or impossible because the echo lies outside the height range recorded.
- X Measurement refers to the extraordinary component.
- Y Intermittent trace.
- Z Third magneto-ionic component present.

b. Qualifying Letters

The following letters are entered in the first column before a numerical value on

the monthly tabulation sheets.

| | |
|---|---|
| D | greater than. |
| E | less than. |
| I | Missing value has been replaced by an interpolated value. |
| J | Ordinary component characteristic deduced from the extraordinary component. |
| O | Extraordinary component characteristic deduced from the ordinary component. (Used for x- characteristics only.) |
| T | Value determined by a sequence of observations, the actual observation being inconsistent or doubtful. |
| U | Uncertain or doubtful numerical value. |
| Z | Measurement deduced from the third magneto-ionic component. |

c. Definitions of the CNT, MED, UQ and LQ

Median count (CNT) is the number of values from which a median has been computed. In addition to numerical values, the count may include certain descriptive letters.

Median (MED) of a set of numbers is the middle value when the numbers are arranged in order of magnitude, or the average of the two middle values if there is an even number of values.

Upper quartile (UQ) is the median value of the upper half of the values when they are ranked according to magnitude; the *lower quartile* (LQ) is the median value of the lower half.

d. Description of Standard Types of Es

The eight standard types of *Es* are identified by corresponding capital letters: F, L, C, H, Q, R, A, S. These letters suggest the names flat, low, cusp, high, equatorial, retardation, auroral and slant, respectively. The letter 'N' is used to designate any *Es* trace that does not correspond to any of the eight types.

F An *Es* trace which shows no appreciable increase of height with frequency. The trace is usually relatively solid at most latitudes. This classification may only be used at night; apparently flat *Es* traces observed in the daytime are classified according to their virtual height: H or L.

L A flat *Es* trace at or below the normal E layer minimum virtual height in the day or below the night E layer minimum virtual height at night.

C An *Es* trace showing a relatively symmetrical cusp at or below f_0E . This is usually continuous with the normal E trace, although when the deviative absorption is large, part or all of the cusp may be missing. (Usually a daytime type.)

H An *Es* trace showing a discontinuity in height with the normal E layer trace at or above f_0E . The cusp is not symmetrical, the low frequency end of the *Es* trace lying clearly above the high frequency end of the normal E trace. (Usually a daytime type.)

Q An *Es* trace which is diffuse and non-blanketing over a wide

frequency range. The spread is most pronounced at the upper edge of the trace. (This type is common in daytime in the vicinity of the magnetic equator.)

R An *Es* trace showing an increase in virtual height at the high frequency end similar to group retardation but which is nonblanketing over part or all of its frequency range. This is distinguished from the usual group retardation (as in the case of an occulting thick *E* layer) by the lack of group retardation in the *F* layer traces at corresponding frequencies and the lack of complete blanketing.

A An *Es* having a well defined flat or gradually rising lower edge with stratified and diffuse (spread) traces present above it. These sometimes extend over several hundred kilometers of virtual height.

S A diffuse *Es* trace which rises steadily with frequency and usually emerges from another type *Es* trace. The rising trace alone is classified as 'S'; the horizontal trace is classified separately. At high latitudes the slant trace usually starts to rise from a horizontal *Es* trace such as *Es-L*, or *Es-F*, at frequencies which greatly exceed the *E* layer critical frequency, whereas at low latitudes it usually rises from *Es-Q* *Es-C* or *Es-H* at frequencies near the regular *E* critical frequency. Type *S* is never used to determine f_0E s and $h'E$ s. The slant trace is sometimes observed to start at f_0E without echoes clearly identifiable as *Es* echoes being seen.

N The designation 'N' is used to denote an *Es* trace which cannot be classified into one of the standard types. When a trace appears to be intermediate between any two classes a choice should be made whenever possible even if it is uncertain. 'N' should be used sparingly.

e. Multiple Reflections from *Es*

When the ionogram shows the presence of multiple reflections from *Es* the number of traces seen should be recorded after the letter indicating the type.

B. SOLAR RADIO EMISSION

Solar radio observations are carried out on 200 and 500 MHz at Hiraiso Branch. Antennas are two parabolic reflectors: 10 meter for 200 MHz and 5 meter for 500 MHz, each having the total power receiver. Observations are feasible almost from sunrise to sunset.

a. Time and Unit

The time is expressed as U.T.

The unit is $10^{-22} \text{ W} \cdot \text{m}^{-2} \text{ Hz}^{-1}$ for both components of polarization.

b. Daily Data

Flux density

The three-hourly and daily mean values are given.

Variability

The three-hourly and daily mean values are given at 200 MHz only.

Variability is expressed in the following four grades:

- 0 = Quiet or no burst,
- 1 = A few bursts,
- 2 = Many bursts,
- 3 = Very many bursts.

The number of bursts exceeding the flux level is counted. Bracket means that observation time does not exceed one third of the period.

c. Distinctive Events

The phenomena are picked up on the following criteria:

1. Distinct from the prevailing kind of activity,
2. Correlated with other known solar phenomena,
3. Remarkable change-over from one situation to another.

Starting time and *Time of maximum* are given to nearest minute in general, but to nearest a tenth minute for short intense occurrences or clear commencements.

Duration is given in minutes and to nearest a tenth minute, if short or clear.

Descriptive type is denoted by the following symbols:

- S = Simple rise and fall of intensity;
- C = Complex variation of intensity,
- C+ = Prolonged broad-band enhancement of radiation, generally of spectral type IV;
- F = Group of bursts: multiple peaks probably belonging to the same event, but separated by relatively short period of quietness;
- RF = More or less irregular rise and fall of intensity, at metric or decimetric wavelengths;
- e = Sudden beginning of burst with steep rise of intensity;
- E = Steep rise of intensity of continuum background;
- p.i. = post-burst increase;
- onset storm = clear-cut beginning of a noise storm.

Peak intensity is the flux density of the highest peak reached during the occurrence, measured above the pre-burst level.

Mean intensity is the flux density averaged over the burst's duration, measured above the pre-burst level; therefore, multiplying the duration, the total energy of the occurrence can be estimated.

C. RADIO PROPAGATION CONDITIONS

a. Field Strengths of WWV and WWVH

Field Strengths observations of WWV and WWVH transmitted from Fort Collins, Colorado and Hawaii, respectively, are carried out at Hiraiso Branch. In order to avoid interferences with other standard frequency waves on the same frequency, the upper side-band of 440 Hz is picked up by the use of a narrow band pass filter with

± 40 Hz bandwidth.

The *tabulated field strength* is the average of peak value of the incident upper side-band field intensity in dB above one microvolt per meter. The *duration* of observation is two minutes for WWV and three minutes for WWVH following the time indicated in universal time on the table.

Particulars of the transmitter and receiver are summarized in the following tables:

Transmitter

| | WWV | WWVH |
|----------|--|---------------------------------|
| Location | Fort Collins, Colorado Lat. 40°41'N | Maui, Hawaii Lat. 20°46'N |
| Power | 3 kW for the upper side-band | 0.5 kW* for the upper side-band |
| Antenna | $\lambda/2$ vertical | $\lambda/2$ vertical |
| Distance | 9150 km | 6270 km |

* Reduced from the carrier power of 2 kW with amplitude modulation of 100%.

Receiver

| | |
|-------------|-------------------------------------|
| Antenna | 4.5 m vertical rod |
| Bandwidth | ± 40 Hz for the upper side-band |
| Calibration | every half an hour |

The meaning of *Descriptive symbols* is as follows:

- C : Measurement influenced by, or impossible because of, any non-propagational reasons.
- S : Measurement influenced by, or impossible because of, interferences or atmospherics.
- U : Inaccurate measurement influenced by interferences, atmospherics, or non-propagational reasons.
- E : Less than the following figure.

b. Radio Propagation Quality Figures

Radio propagation quality figures are usually expressed on the scale that ranges from one to five as follows:

- | | |
|--------------------------------|------------|
| 1 = very poor (very disturbed) | 4 = normal |
| 2 = poor (disturbed) | 5 = good |
| 3 = rather poor (unstable) | |

The tabulated circuits contain Hamburg (commercial circuit), WWV (10, 15 and 20 MHz frequencies broadcast from Fort Collins, Colorado), Lima (commercial circuit) and WWVH (10 and 15 MHz frequencies broadcast from Hawaii), which are received at Hiraiso Branch.

Warnings of radio propagation which are broadcast from JJY station are expressed in three grades:

N = normal
U = unstable
W = disturbed

The letter W expresses HF propagation disturbances which are expected to occur during the following 12 hours after issue. The letter U and N also means unstable and normal conditions, respectively.

Whole day radio quality indices stand for the averages of the 6-hourly indices of the circuits of Hamburg, WWV and Lima.

Start-and end-time of principal geomagnetic storms correlated with radio propagation conditions are tabulated from observations at Kakioka Magnetic observatory.

c. Sudden Ionospheric Disturbances (S.I.D's.)

(i) SWF

The data of short wave fade-out (SWF) are prepared from the records of field intensities at Hiraiso, of the following circuits. Start-time, Duration, Type and Importance are obtained from the data of a circuit whose Drop-out Intensity is underlined. Drop-out Intensities of 10, 15 and 20 MHz are indicated by ('), (none), and ("), respectively. Characteristics of the phenomenon are classified as follows.

Circuits and Drop-out intensities

CO WWV 20, 15 and 10 MHz (Fort Collins, Colorado)
LM Various frequencies of commercial circuit (Lima)
HA WWVH 15 and 10 MHz (Hawaii)
TO JJY 15 and 10 MHz (Tokyo)
SH BPV 15 and 10 MHz (Shanghai)
HB Various frequencies of commercial circuit (Hamburg)

Start-time and Duration

Types

S : sudden drop-out and gradual recovery
Slow : slow drop-out taking 5 to 15 minutes and gradual recovery
G : gradual disturbances; irregular change in both drop-out and recovery

Importances

Degrees of SWF are classified into 9 grades according to the amplitude of fade-out;

| | | |
|-----|---|-----|
| 1 - | 1 | 1 + |
| 2 - | 2 | 2 + |
| 3 - | 3 | 3 + |

Besides, the time of phenomena associated with SID's, that is, solar flare, solar radio noise outburst and crochet (solar flare effect in magnetic record), are given in this table from interchange messages of IUWDS or measurements at Hiraiso.

(ii) SPA

The data of sudden phase anomaly (SPA) are prepared from the records of phase measurement of VLF radio wave propagation received at Inubo Radio Wave Observa-

tory. Characteristics of the VLF radio wave propagation are as the following table. In the last column, a spherical earth with a radius of 6371.2 km is assumed.

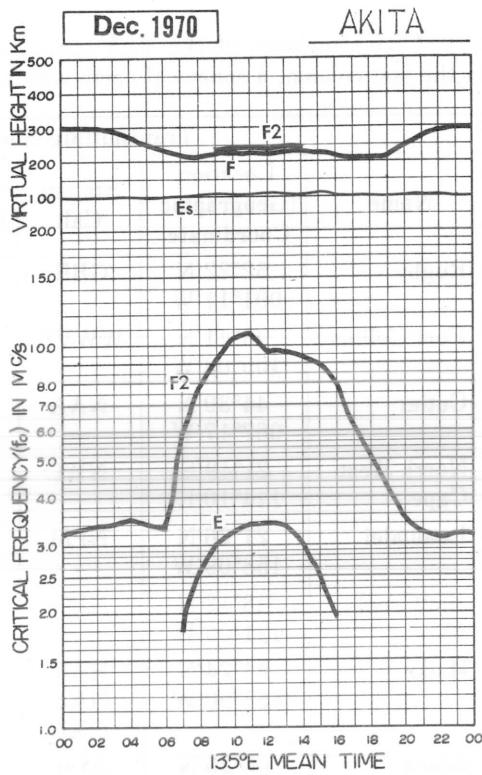

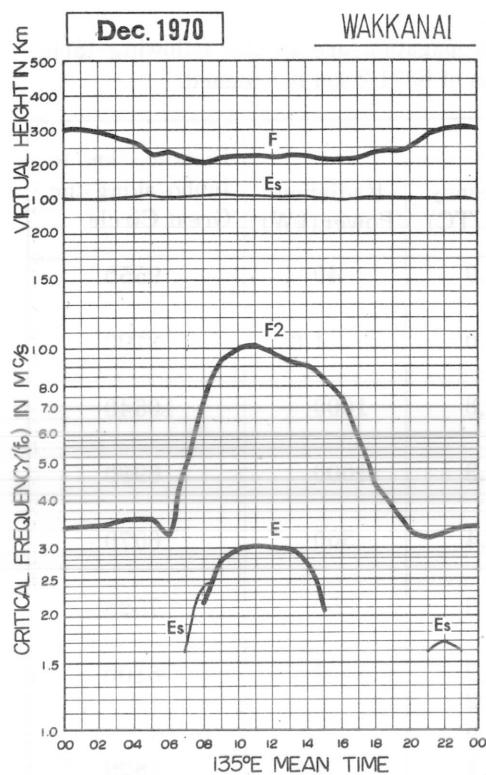

| Transmitting Site | | | | | Distance (km) to Inubo along the Great Circle |
|--------------------|--|-------------------|------------------------|-------------------------|---|
| Name | Location (Geographic Coordinate) | Station Call | Frequency (kHz-UTC) | Radiation Power (kW) | |
| Rugby | 52°22'N 001°11'W | GBR | 16.0 | 40 | 9550 |
| Fort Collins | 40°41'N 105°03'W | WWVL | 20.0 | 1.8 | 9190 |
| Cutler | 44°39'N 067°17'W | NAA | 17.8 | 1000 | 10640 |
| North West Cape | 21°49'S 114°10'E | NWC | 22.3 | 1000 | 6990 |
| Lualualei | 21°26'N 158°09'W | NPM | 23.4 | 300 | 6070 |
| Jim Creek | 48°12'N 121°55'W | NPG | 18.6 | 250 | 7620 |
| Haiku | 21°24'N 157°50'W | HA0 HA2 HA3 | 10.2 12.2 13.6 | 2 | 6100 |
| Aldra | 66°25'N 013°09'E | AL0 AL2 AL3 | 10.2 12.2 13.6 | 4 | 7820 |

The phase advance is shown in its maximum stage. In the column 'Phase Advance', — means no transmission or no reception during the period, and blank means indistinguishable record.

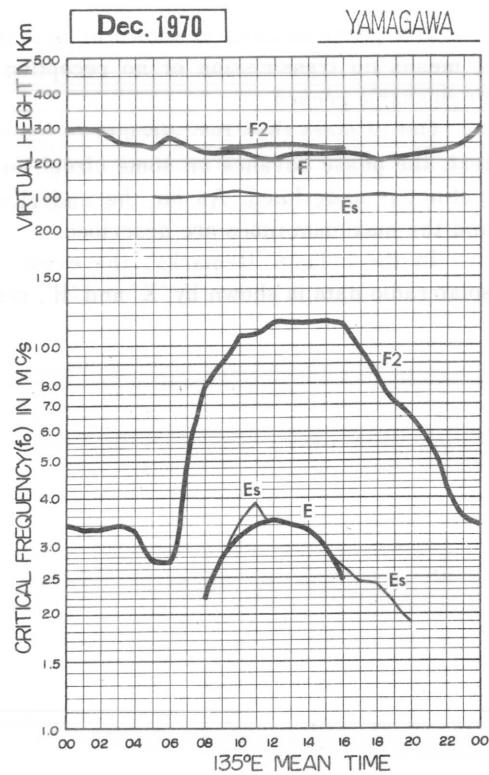

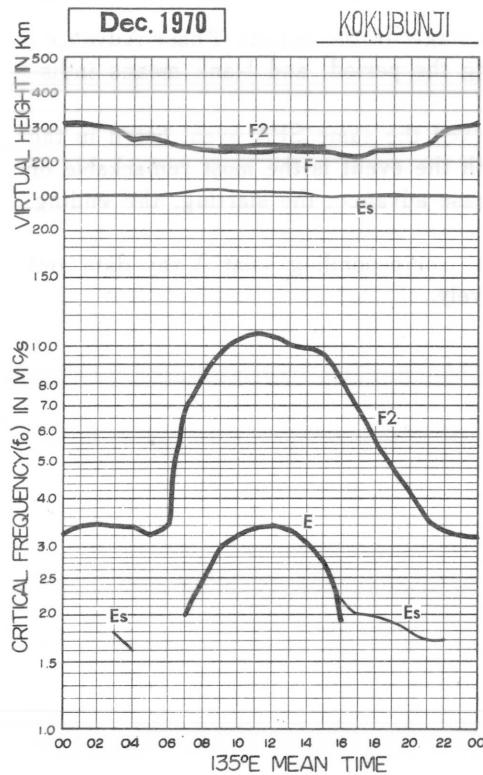

Out of more than two circuits to have observed the same SPA event listed in the text, the phase advance on some circuit on which the event is the most remarkable or distinct is underlined. As for the underlined phase advance, the starting, the ending, and the maximum times are described.

In the column 'Remarks', the event with its corresponding solar X-ray data and solar radio data is shown by 'X' and 'R', respectively.

NOTES (1) : The letter E or D attached to a time shows that the pertinent time is earlier or more delayed than the given time, respectively.

(2) : The mark * Shows a multi-peak event.

(3) : The mark ** shows a time on the day before the pertinent day.
